Data Folder Structure

APPN Aerial SOP — Locked revision 1.03

Data Folder Structure

APPN aerial data follows a standard folder layout so raw, processed, and metadata artefacts are consistent across nodes, sites, sensors, and runs.

Reference

Full specification: APPN_GenricFileStorage wiki.

Standard path

```
./{NodeName}/{Project}/{Site}/{Sensor}/
 {YYYYMMDD}/Run_{XX}/T0_raw
```

Per-run / per-day artefacts

All paths below are relative to the per-day folder:

`./{NodeName}/{Project}/{Site}/{Sensor}/{YYYYMMDD}/`

Artefact	Suffix under day folder	Notes
Raw capture data	`Run_{XX}/T0_raw`	Hyperspec cubes, LiDAR, GNSS-INS, `.graw`
GCP data	`Run_{XX}/T0_raw/Vault`	Location may change; see fieldbook
Field notes	`FieldNotes.txt`	Per-day, free-text issues log
Run overview	`RunOverview.csv`	Per-run metadata (APEx conditions, `RunFailed`)
Processed data	`Run_{XX}/T1_proc`	`.gpro` from APPN GPT pipeline

> **Important**
>
> When data from a failed run is being kept (e.g. for debugging with GRYFN), set the `RunFailed` boolean column of `RunOverview.csv` to `True`.

Site-level documentation

Site-wide reference data (plot layouts, trial information, etc.) lives in a sibling `Documentation/` folder at the **site** level — alongside each sensor's data, not inside any sensor or per-day folder:

```
./{NodeName}/{Project}/{Site}/
 Documentation/
 Plot_Layout/
 Trial_Info/
 {Sensor}/
 {YYYYMMDD}/Run_{XX}/T0_raw
```

`Documentation/Plot_Layout/`

Holds the **plot polygon vector files** that every sensor's processing pipeline keys off. Three families of file are recognised — see the Plot Delineation protocol for the full specification.

Artefact	Filename pattern	Notes
Main plot file *(mandatory)*	`{YYYYSiteName}_plots.geojson`	The single required file. Entry point for every downstream pipeline.
Plot variants *(optional)*	'{YYYYSiteName}*plots*{descriptor	sensor}[_v{NN}].geojson'
Sampling files *(optional)*	`{YYYYSiteName}_sampling_{measurement}_{YYYYMMDD}[_v{NN}].geojson`	One per measurement type (`biomass`, `height`, `emergence`, `headcount`, …).
Permanent GCPs *(optional)*	`{YYYYSiteName}_gcp[_v{NN}].geojson`	Permanent surveyed markers only — temporary per-flight GCPs stay with the flight (`Run_{XX}/T0_raw/Vault`).
Tool config sidecar	`{YYYYSiteName}_plots_v{NN}.json`	e.g. FIELDimageR settings — saved alongside the plot file for reproducibility.
Deprecated copies	`…_deprecated.geojson`	Superseded files retained for provenance (terminal `_deprecated` tag).
Folder README *(strongly recommended)*	`README.md`	Site-specific context: current main file, variants in use, deprecation log, known quirks.

> **Important**
>
> `{YYYYSiteName}_plots.geojson` is the **only mandatory vector file** and must exist for every APPN project and site. All other files in the folder are optional.

`Documentation/Trial_Info/`

Holds the **trial-information spreadsheet(s)** that join to the plot file via `plot_id`. APPN mandates only the `plot_id` column — every other column is trial-specific. See Joining Trial Information.

Artefact	Filename pattern	Notes
Trial info (current)	`{YYYYSiteName}_trial_info.csv`	CSV preferred; XLSX accepted. Must include a `plot_id` column matching the plot file.
Deprecated copies	`{YYYYSiteName}_trial_info_{YYYYMMDD}_deprecated.csv`	Same `_deprecated` / `_v{NN}` conventions as plot files.
Folder README *(strongly recommended)*	`README.md`	Source spreadsheets, contacts, column definitions, quirks.
